

Don calls for new approaches to food production

Climate change prediction models have indicated that food production in the future will be a challenge due to increased temperature and fluctuating rainfall patterns. According to Dr. Jake Bishop, a researcher from the University of Reading, United Kingdom, 75% of staple crops globally, rely on insect pollinators which he warned were being phased out by climate change. <http://www.jkuat.ac.ke/don-calls-for-new-approaches-to-food-production/>
